

**SYSTEM ANALYTIC LAUNCHES HEADLINE VIDEOS – A NEW, POWERFUL CHANNEL TO COMMUNICATE PUBLISHED SCIENTIFIC DATA TO PHYSICIANS THAT MAY NEVER HAVE TO THE OPPORTUNITY TO READ THE ORIGINAL PUBLICATION**

**LONDON** – System Analytic, a leading provider of KOL-focussed digital tools and services for pharmaceutical companies, today announced the launch of a new generation of its novel Headline Video offering which enables pharmaceutical medical affairs, commercial, and publication teams to use machine-generated short-form video to maximise the communication of scientific data previously published through publications, abstracts, or posters.

Medical affairs, commercial, and publication teams in pharmaceutical companies spent significant time and money creating important publications, abstracts, and posters to communicate key scientific data and research. Not all physicians will have the opportunity, time, or access to be able to read the full original article outlining the important data or research.

So instead of asking them to read the full paper, Headline Videos enable them to watch a short, focused video summary of the publication on their phone instead.

The new generation of Headline Videos announced today enables the use of multilayer graphics that animate within the main video, to help create headline videos of up to 3 minutes in length, but still at a fraction of the price of traditional videos.

Unlike traditional video abstracts or enhanced videos, Headline Videos are created semi-automatically using predesigned template, set scenes, and machine intelligence, with medical writer input to ensure the accuracy of key message content which always references the original publication. KOLs involved in the original publication, abstract, a poster can also contribute to Headline Video content.

This enables Headline Videos to be generated rapidly and cost effectively, translated easily, and be shared across all digital social media channels with complete ease.

Dr Sanjay Singhvi, a Director at System Analytic, said “Attention spans are dropping, the consumption of short form video on mobile devices is rising, and machines are taking over, so naturally we combined all of this to create a new powerful innovative channel through which our clients can communicate previously published scientific data to a much wider healthcare audience. Reading a scientific publication in full is always good, but sometimes watching the key points about it on your phone while having a coffee or gin can be easier, and that’s why our clients love Headline Video”.
